

Week 5 Case Study: GlobalPort Logistics

As GlobalPort Logistics prepares for its urgent transformation for a reliable, scalable, and integrated operating model that optimizes costs and supports consistent global expansion, leadership has raised heightened concerns around security and compliance. With operations spanning multiple countries, warehouses, and transport hubs, even a minor security lapse could disrupt business continuity, compromise sensitive customer and trade data, and trigger regulatory penalties.

GlobalPort's key security challenges include:

- **Confidentiality:** Sensitive shipment, customs, and client data is at risk of exposure across regions due to weak access controls and siloed systems.
- **Integrity:** Audit trails are incomplete, and data is inconsistent due to missing validations and unauthorized changes.
- **Availability:** Frequent outages and system downtime disrupt 24/7 operations, leading to delays, dissatisfied clients, and financial penalties.
- **Compliance:** Regulations such as GDPR and international trade compliance laws require demonstrable safeguards, but existing systems lack the controls and documentation to meet these requirements.

To address this, ServiceNow has provided security architecture recommendations, including a three-layer security model:

1. Three layered platform security with their features:
 - **Network layer:** IP address-based access control, certificates, and secure connectivity through Virtual Private Network (VPN)
 - **Application layer:** Zero Trust Access (ZTA) framework, adaptive authentication, role-based authorization, and secure API integrations with external systems
 - **Data layer:** ServiceNow Vault for advanced data protection, including platform encryption
2. Security enhancements:
 - Enforcing role-based access controls
 - Automating compliance reporting and enabling real-time monitoring dashboards
 - Protecting physical data centers with strict security measures
 - Maintaining detailed audit trails for all system activities
 - Using IntegrationHub and Flow Designer to enable secure, standardized workflows
 - Conducting periodic reviews of access privileges and audit logs across all systems

Leadership remains unconvinced, questioning whether this framework is sufficient to protect operations, comply with regulations, and scale globally.

CTA focus area

As Certified Technical Architects (CTAs), you are approached by the Enterprise Architect (EA) to review ServiceNow's security architecture recommendations and prepare key points for the EA to present to leadership, explaining how ServiceNow's security model addresses GlobalPort Logistics' concerns.
