

Security Architecture Activity Instructions

Before you start the project, access the activity documents containing the case study and templates. Review the scenario description carefully, analyze the challenges, and collaborate with your group to complete the tasks.

Task 1: Review the scenario and the three-layer security model

As a team of CTAs, review the scenario, drawing on your experience and learnings from the Security Architecture module. Focus on identifying and gathering talking points about why this security architecture is effective. on the following questions to summarize your insights into one discussion post:

1. Does the proposed architecture sufficiently address confidentiality, integrity, availability, and compliance concerns? Why or why not?
2. Are all three layers of security (network, application, and data) covered adequately? Where do you see potential gaps?
3. What risks or operational challenges might remain unaddressed for GlobalPort Logistics under the current recommendations?
4. How would you present the architecture's value to GlobalPort's leadership, and which benefits: such as regulatory compliance, risk mitigation, operational resilience, or scalability would you emphasize as most important, and why?

Task 2: Draft a discussion board post

Consolidate your insights into a single discussion post that addresses the four questions to start your discussion thread.

Instructions for submitting:

One member of the group will post in the group activity discussion board under the topic that corresponds with their group number.

Once the review period begins, each person will complete two peer reviews for another group by commenting on their posts.

NOTE: Each individual must contribute to the discussion board by commenting on other groups' post in order to receive credit towards the weekly badge.
